

Name: Cruz, Patrick Danielle C.	Date Performed: Aug 8, 2025
Course/Section: CPE212 - CPE31S4	Date Submitted: Aug 8, 2025
Instructor: Engr. Robin Valenzuela	Semester and SY: 1st semester

Activity 1: Configure Network using Virtual Machines

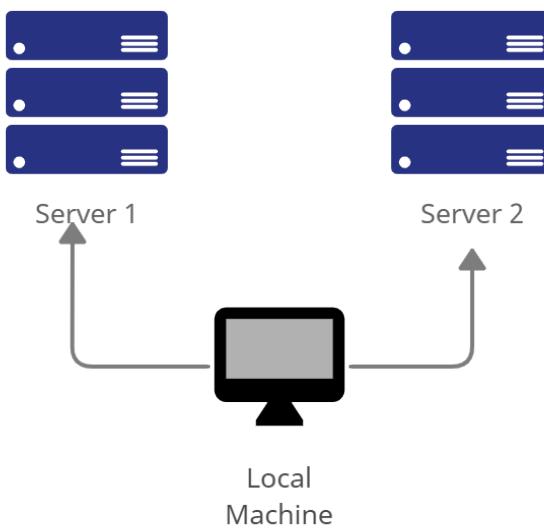

1. Objectives:

- 1.1. Create and configure Virtual Machines in Microsoft Azure or VirtualBox
- 1.2. Set-up a Virtual Network and Test Connectivity of VMs

2. Discussion:

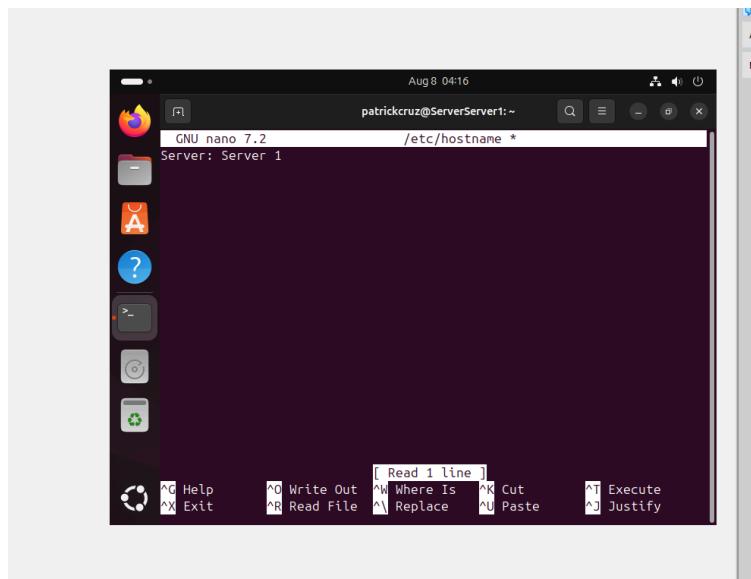

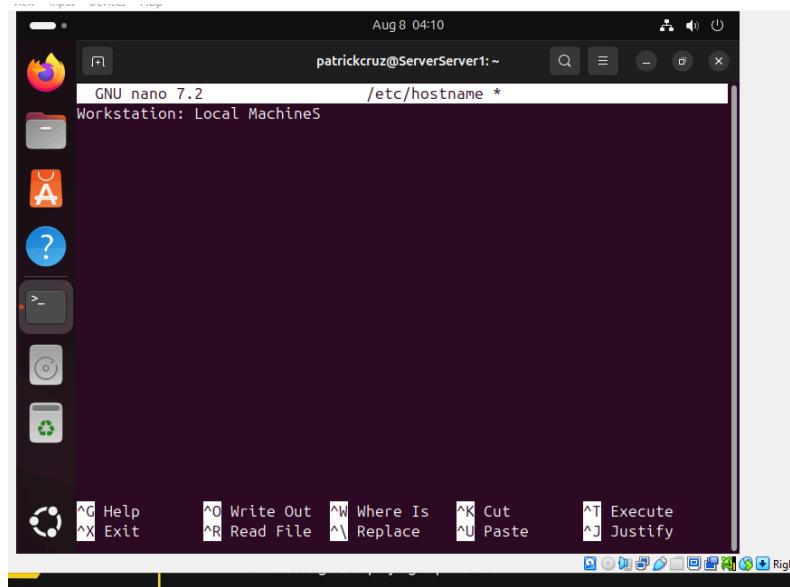

Network Topology:

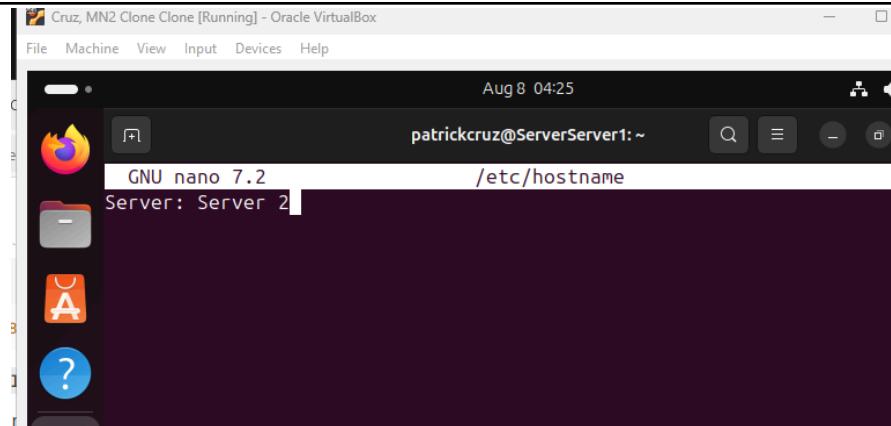

Assume that you have created the following network topology in Virtual Machines, **provide screenshots for each task**. (Note: *it is assumed that you have the prior knowledge of cloning and creating snapshots in a virtual machine*).

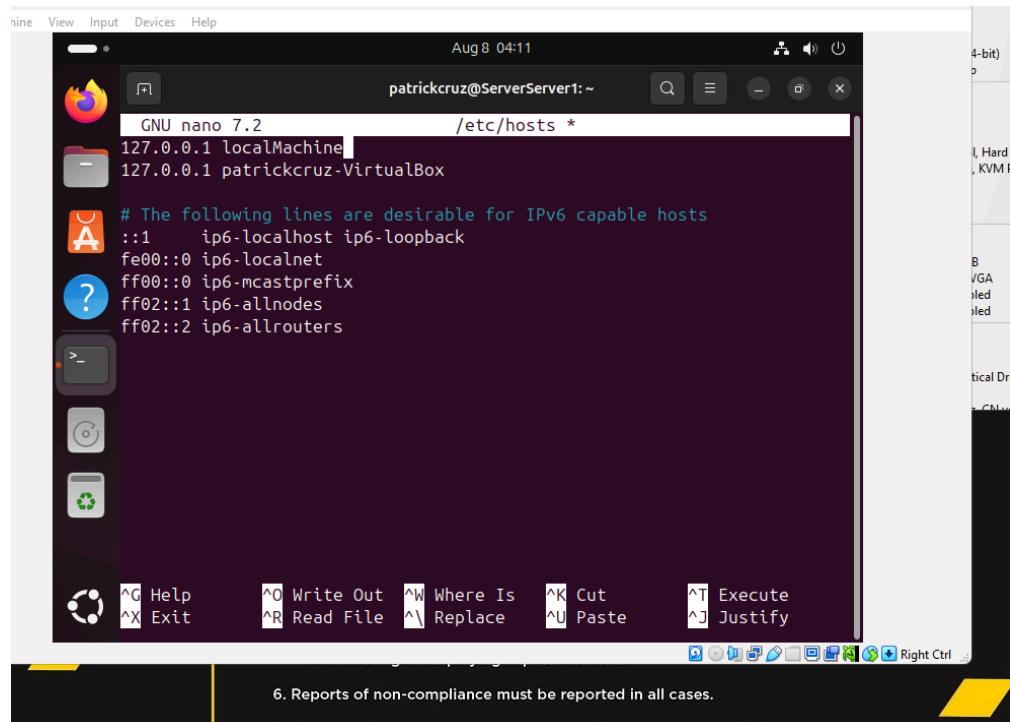

Task 1: Do the following on Server 1, Server 2, and Local Machine. In editing the file using nano command, press control + O to write out (save the file). Press enter when asked for the name of the file. Press control + X to end.

1. Change the hostname using the command ***sudo nano /etc/hostname***
 - 1.1 Use server1 for Server 1
 - 1.2 Use server2 for Server 2
 - 1.3 Use workstation for the Local Machine

2. Edit the hosts using the command *sudo nano /etc/hosts*. Edit the second line.
 - 2.1 Type 127.0.0.1 server 1 for Server 1
 - 2.2 Type 127.0.0.1 server 2 for Server 2
 - 2.3 Type 127.0.0.1 workstation for the Local Machine

6. Reports of non-compliance must be reported in all cases.

7. User found to have violated elements of this Acceptable Use Policy shall be subject to disciplinary action.

Aug 8 04:17

patrickcruz@ServerServer1: ~

```
GNU nano 7.2          /etc/hosts *
```

127.0.0.1 localhost
127.0.0.1 patrickcruz-Server1

The following lines are desirable for IPv6 capable hosts
::1 ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters

Exit Read File Replace Paste Justify

Task 2: Configure SSH on Server 1, Server 2, and Local Machine. Do the following:

1. Upgrade the packages by issuing the command `sudo apt update` and `sudo apt upgrade` respectively.

The screenshot shows a terminal window titled "Cruz, CN [Running] - Oracle VirtualBox". The terminal is displaying the output of the `sudo apt upgrade` command. The output includes messages about processing triggers for various packages like `linux-image-6.14.0-27-generic`, updating initramfs, sourcing grub configuration files, and generating grub configuration files. It also shows the detection of other bootable partitions and the creation of new boot entries. The command `done` is shown, followed by the message "patrickcruz@ServerServer1:~\$".

```
Processing triggers for linux-image-6.14.0-27-generic (6.14.0-27.27~24.04.1) ...
/etc/kernel/postinst.d/initramfs-tools:
update-initramfs: Generating /boot/initrd.img-6.14.0-27-generic

22/tcp                      ALLOW      Anywhere
22/tcp (v6)                 ALLOW      Anywhere (v6)
```

Task 3: Verify network settings on Server 1, Server 2, and Local Machine. On each device, do the following:

1. Record the ip address of Server 1, Server 2, and Local Machine. Issue the command **ifconfig** and check network settings. Note that the ip addresses of all the machines are in this network 192.168.56.XX.

1.1 Server 1 IP address: 192.168.56.104

1.2 Server 2 IP address: 192.168.56.107

1.3 Server 3 IP address: 192.168.56.108

```
patrickcruz@ServerServer1:~$ ping 192.168.56.108 -c 3
PING 192.168.56.108 (192.168.56.108) 56(84) bytes of data.

```

2. Make sure that they can ping each other.

- 2.1 Connectivity test for Local Machine 1 to Server 1: ✓ Successful Not Successful
- 2.2 Connectivity test for Local Machine 1 to Server 2: ✓ Successful Not Successful
- 2.3 Connectivity test for Server 1 to Server 2: ✓ Successful Not Successful

Task 4: Verify SSH connectivity on Server 1, Server 2, and Local Machine.

1. On the Local Machine, issue the following commands:

1.1 ssh username@ip_address_server1 for example, **ssh jvtaylor@192.168.56.120**
1.2 Enter the password for server 1 when prompted

```
patrickcruz@192.168.56.104's password:

```

```
patrickcruz@server2:~$ logout
Connection to 192.168.56.107 closed.
patrickcruz@server2:~$ █
```

4. Edit the hosts of the Local Machine by issuing the command ***sudo nano /etc/hosts***. Below all texts type the following:
 - 4.1 **IP_address server 1** (provide the ip address of server 1 followed by the hostname)
 - 4.2 **IP_address server 2** (provide the ip address of server 2 followed by the hostname)

```
GNU nano 7.2                               /etc/hosts
127.0.0.1 localMachine
127.0.0.1 patrickcruz-VirtualBox
192.168.56.104 server1
192.168.56.107 server2
# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
```

4.3 Save the file and exit.

5. On the local machine, verify that you can do the SSH command but this time, use the hostname instead of typing the IP address of the servers. For example, try to do **ssh jvtaylor@server1**. Enter the password when prompted. Verify that you have entered Server 1. Do the same for Server 2.

```
patrickcruz@ServerServer1:~$ sudo nano /etc/hosts
patrickcruz@ServerServer1:~$ ssh patrickcruz@server1

Reflections:

Answer the following:

1. How are we able to use the hostname instead of IP address in SSH commands?

- In SSH commands the hostname may be used in place of an IP address since the SSH client relies on the name resolving system of the operating system providing the translation of the hostname to its IP address equivalent. This resolution is normally achieved by use of DNS servers, local /etc/hosts file or other services involved in globally discovering names in the network. When you enter in ssh user@hostname your system queries the IP address that is mapped to hostname in these ways without connecting to the SSH daemon on the remote machine.

2. How secured is SSH?

- When properly set up, SSH is regarded to be extremely secure. It employs encrypted authentication credentials to guard against eavesdropping and man-in-the-middle attacks by encrypting all communication between the client and the server. SSH supports authentication mechanisms that need a high level of authentication, such as public-key authentication and multi-factor authentication. It employs powerful encryption techniques and safe key exchange, ensuring data security and integrity. The security relies on recommended practices such as blocking root login via SSH, using strong passwords or keys, keeping the server up to date, and carefully managing user access. When properly implemented, SSH is a tried-and-true method for providing secure remote services and administration.
